

The Series PAC (Pivoting Articulated Crane) Arm may be supplied with a 24" round hood or a balancer hose drop. The hood may be used for positioning over vertical exhaust pipes of vehicles, positioned above welding areas or other work stations where air borne particulate needs to be controlled. The balancer drop can be provided with a number of nozzle options for attachment to fume sources.

The unique range of movement of the PAC allows the positioning of hood or balancer drop anywhere within the radius reach of the PAC.

The addition of a curtain enclosure to the hood can provide additional reach to the fume source. The curtain can create a moveable work booth from the end of the PAC.
